

Top 5 Technical Analysis Mistakes

1. Trading Every Pattern You See

Jumping into trades just because a pattern **looks** familiar often leads to poor setups. Always validate the pattern within market context.

2. Relying Too Heavily on Indicators

Indicators are tools to support decisions - not automatic signals. Avoid indicator overload and prioritize price action.

3. Ignoring Trend and Structure

Entering trades without aligning with market trend or identifying key support/resistance levels increases risk.

4. Skipping Confirmation

Trading without confirming setups with volume, candle structure, or multi-timeframe alignment results in more false signals.

5. Letting Emotions Drive Analysis

Overconfidence, fear, or FOMO can cause you to see signals that aren't there. Stay objective and use a consistent process.
